Shazam Algorithm for Partial Video Copy Detection

Authors: Rustam Sh. Uzdenov, Andrey I. Perminov

Venue: *Proceedings of ISP RAS*, 2025.

Summary: This work adapts ideas from audio fingerprinting (in the spirit of Shazam-style hashing) to the visual domain for **partial video copy detection**: locating segments of a query video that reappear inside a larger reference or corpus, even when copies are cropped, re-encoded, or otherwise degraded. The paper contributes algorithm design and analysis for robust visual fingerprints, enabling scalable matching analogous to classical audio ID systems but tailored to frame and spatio-temporal structure in video.

The research was carried out at **ISP RAS** (Institute for System Programming of the Russian Academy of Sciences). The same line of work was presented at **IVMEM 2025** and supports the author's bachelor's thesis at Bauman MSTU on partial video copy detection using audio-fingerprinting-inspired methods.
